For defense and commercial aircraft, this version of Gore's quadrax cables is the premier solution for copper-based IEEE 1394b FireWire® data links. They transmit uninterrupted high-fidelity signals with flexure for interconnect solutions up to 30 m (100 ft) at 5400 data transfer rates (Table 1).

Built with durable materials that are highly flexible, Gore's cables provide a protective barrier against tough aircraft environments for long-term product life (Figure 1).

Also, Gore's quadrax design is approximately 40% smaller than dual twisted pair constructions (Figure 2). These cables are also proven to save as much as 5.2 kg (11.5 lb) per aircraft.

Cable Preparation

Laser stripping is the ideal method to prep GORE® FireWire® Cables. Alternatively, Gore recommends using thermal or sharp mechanical strippers. Also, a unique method is to make a short, horizontal slit in the jacket material, peel it back to allow for contact termination and return the jacket to its original position for a neat closure (Figure 3). For more information regarding cable preparation, contact a Gore representative.

Signal Integrity with Flexure

To ensure signal integrity with flexure of GORE® FireWire® Cables, the eye pattern of a 15-m (50-ft) cable transmitting 500 Mb of data was evaluated before and during flexure. The diamond-shaped eye mask indicates the minimum receiver sensitivity as specified by IEEE 1394b (Figure 3).

Results indicated that Gore's cable passed the eye mask test with margin, indicating greater transmission length is possible. The eye pattern test was repeated with the cable wrapped 20 times around a 12.7-mm (0.5-in) radius mandrel. No substantial degradation in signal quality was observed with flexure (Figure 4).
